

Safety Shield Installation

1. Wrap the safety shield tightly around the flanges, valve or fitting.
2. Press the two parts of the velcro fastenings together to close the shield.
3. Pull the tie cords together tightly on each side, take one or two turns around the pipe and fasten over the pipe with a reef knot – right over left and under, left over right and under. Only a reef knot should be used as this will tighten under pressure.
4. Do not cut the tie cords but tuck them in between the flange and shield.
