Joint Integrity Tag for PTFE/PFA Lined Piping

Provides a visual indication of the condition of the joint.
Helps build a database of joint history.

The CRP Joint Integrity Tags are a great way to help ensure that all flanged joints in a PTFE lined piping system are properly assembled and checked.

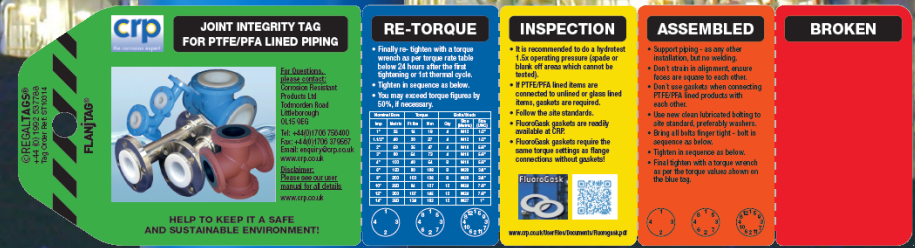

The weatherproof plastic tags are secured to the flange joint and provide a quick and clear visual indication of the condition and safety of the flange assembly.

The tags are multipart with individual numbers and have 5 sections. At each stage in the commissioning of the assembly the tag sections are completed with information and removed from the main tag to collate together and form a central information store on the condition of all the joints within the scope of works.

The Works Manager can quickly identify which joints still need attention and where they are located within their process.
